

INSTRUCTIONS

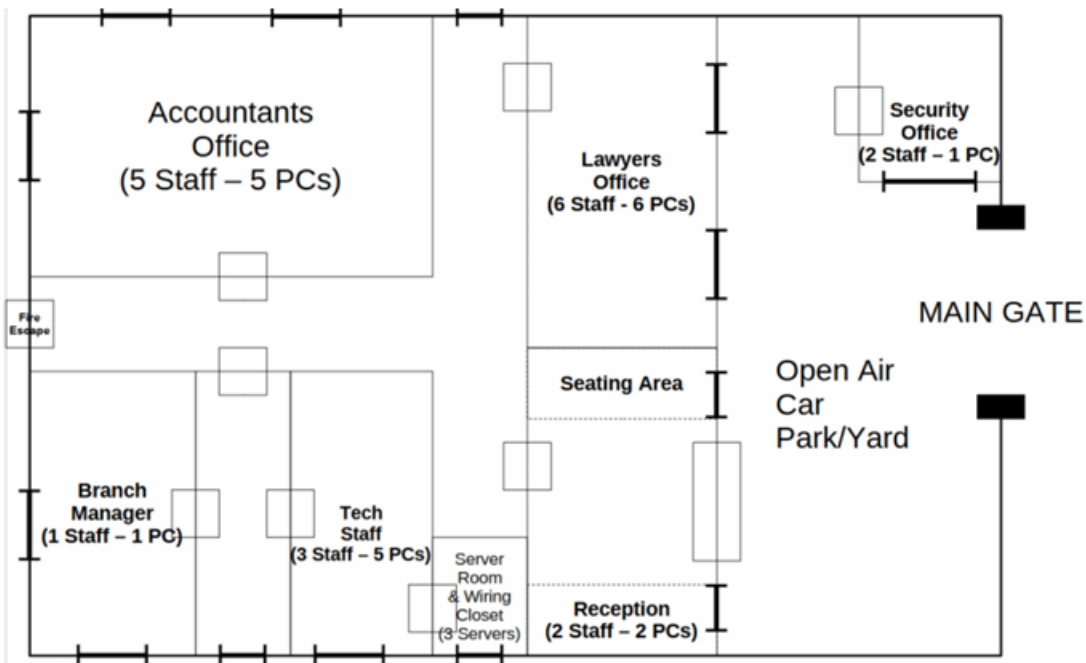

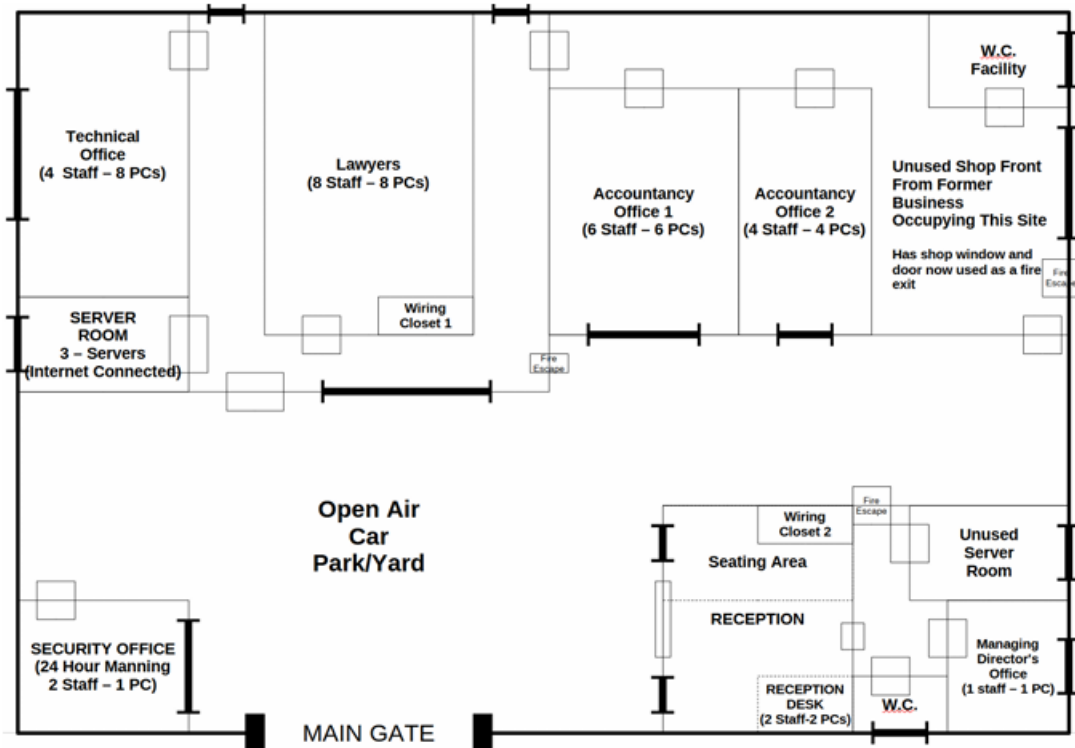

A law firm has recently set up a base in western Edinburgh. They had to set things up in rather a hurry to make sure their cash-flow was running nicely to ensure business success. In the process of this, they took ownership of a business site near the edge of the city in the far west end. The site consists of two separate buildings with their own enclosed car parking yards. They used to belong to separate businesses but do have the capacity for this firm. They are set on different sides of the street from each other.

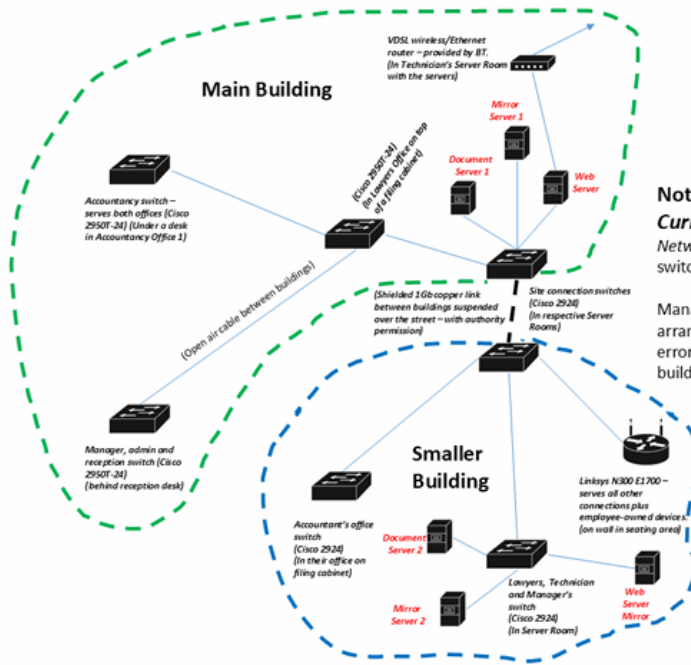

Because of the rapid setup, they have had no real time to look at any network security at all, and have only put together a simple switched network to get them started. They had access to some existing Cisco equipment so they thought they had done a really good job in getting going. However, disaster struck, and they got hacked - which if it had not been for the quick thinking of one employee, who cut the Internet connection in time (separate VDSL connections- one per site), could have resulted in the loss of a large amount of private customer legal data.

To this end, they would like a network security consultant (that's you!) to examine their existing set up and make plans and recommendations for doing the job properly to avoid future disasters as far as is possible.

You have been given the floor plans of the 2 buildings and also a network schematic which shows how their network is currently wired up. The three server units on the diagram are a Web server which has a direct link to the Internet, and a document server and its mirror backup. The other building has 3 servers as well to match.

Examine the site diagrams below and their accompanying initial network design:

Edinburgh – Temporary Network

Notes:

Currently a simple(ish) switched network.

Network = All systems except wireless – using 195.2.2.0/24 – flat switched network.

Management would appreciate a better and more secure subnet arrangement (also they experience regular network errors/problems). Security Offices are not connected yet (both buildings).
